

Alberta's Supply Outlook Model: Education and Skills, 2007-2017

Digitized by the Internet Archive
in 2016

https://archive.org/details/albertassupplyou00albe_3

Highlights

- The proportion of Albertans with a post-secondary education is expected to increase from 48.8% to 52.5% over the forecast period of 2007 to 2017.
- More females than males, 55.8% compared to 49.3%, are expected to have obtained a post-secondary education by 2017.
- There will be more people who have graduated from the fields of education, humanities, social sciences, engineering, and mathematical and computer sciences at the university level than from college and trade institutions.
- It is expected that there will be more Albertans with fine arts, commerce, applied sciences and health professions qualifications at the college and trade level than the university level.
- At the college and trade level a higher percentage of males than of females will have qualifications in the applied science technologies and trades field. Females are expected to have higher percentages with education, commerce, arts, social sciences, and health qualifications.
- Of those Albertans with university degrees, females are more likely than males to have studied in education and health fields. Males are more likely to have engineering and mathematical and computer sciences qualifications.
- Ways of attracting people of the non-traditional gender into trades and health fields of study should be looked at to help ease potential labour shortages.

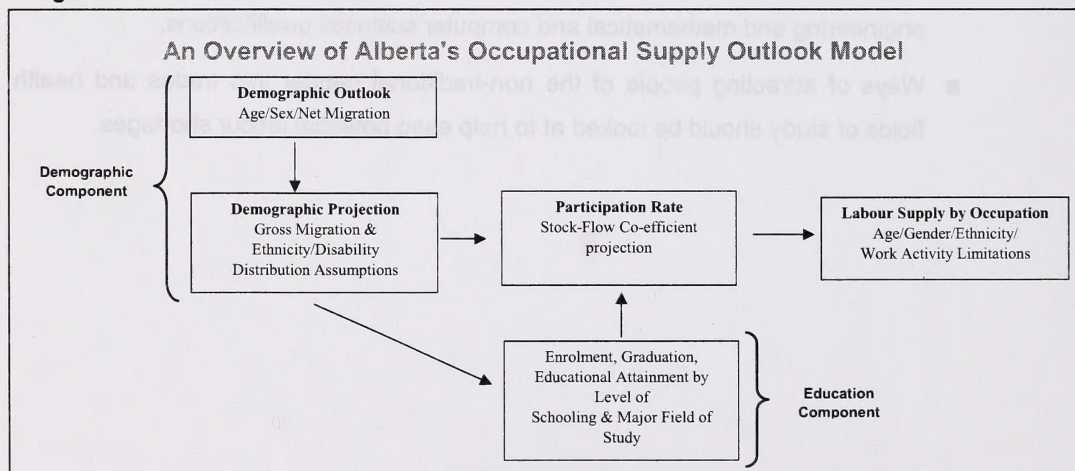

Introduction

Each year Alberta Employment, Immigration and Industry (EII) produces Alberta's Occupational Supply Outlook Model (AOSOM)¹. The AOSOM provides labour supply forecasts for 140 occupational groups covering a 10-year forecast period. The model contains 30 linked sub-models and more than 100,000 data series.

The education sub-model is a critical component of the AOSOM. The model forecasts the number of enrolments and graduates across eleven major fields of study, listed in Appendix A, for different levels of schooling. These forecasts can be translated into the occupations where these people are expected to look for employment. Figure 1 provides an overview of the AOSOM and the role of the education component in forecasting labour supply.

The first section of the report looks at the projected educational attainment levels of Alberta's population. The remainder of the report gives an analysis of the major fields of study at different post-secondary education levels and by gender. Following the text, Appendix B details the assumptions underlying the education forecasts and Appendix C shows the results of the model projections.

Figure 1

¹ See <http://employment.alberta.ca/cps/rde/xchg/hre/hs.xsl/2656.html> for more reports on Alberta's Occupational Supply Outlook

Educational Attainment

Over the forecast period of 2007 to 2017, the proportion of people with a post-secondary education is expected to increase from 48.8% to 52.5%. Meanwhile, the other categories, less than high school and high school, are expected to decrease. Chart 1 compares the proportion of each gender projected to have attained each level of education in 2007 and 2017. It is expected that females will have larger proportions with post-secondary education in 2017 than males, 55.8% compared to 49.3%.

Chart 1

Data Source: Alberta's Occupational Supply Outlook Model, 2007-2017

Chart 2 shows the average annual change in educational attainment between 2007 and 2017 for males, females, and for both genders. While the university degree attainment level shows the highest average annual change with 3.1%, high school has the lowest at 0.1% per year. Females are expected to have higher growth rates than males for post-secondary levels of attainment, and lower for high school and less than high school attainment levels. These changes are the result of an increase in post-secondary enrolment rates over the forecast period, particularly for females.

Chart 2

Data Source: Alberta's Occupational Supply Outlook Model, 2007-2017

Major Fields of Study: College vs. University

Chart 3 compares the average proportions in each major field of study between college and trade and university levels of educational attainment. There are certain major fields of study that have different representations at the college and trade level than at the university level. There are higher proportions with education, humanities, social sciences, engineering, and mathematical and computer sciences qualifications from universities than from college and trade institutions. On the other hand, there are larger proportions with fine arts, commerce, applied sciences, and health professions qualifications at the college and trade level than at the university level. The only major fields of study where the proportions are similar between college and trade and university are agricultural, biological, nutritional, and food sciences.

Chart 3

Data Source: Alberta's Occupational Supply Outlook Model, 2007-2017

These differences are likely due to the differences in degree and diploma programs offered by college and trade institutions compared with universities. These differences remain similar over the forecast period of 2007 to 2017, as there are no significant changes in the proportions at either educational attainment level over the period.

Major Fields of Study: College and Trade

Chart 4 compares the average proportions over the forecast period 2007 to 2017 of all college and trade graduates in each major field of study by gender. There are higher proportions of females than males with qualifications in most major fields of study, except for applied science technologies and trades, with 62.3% of males compared to 9.9% of females. Females have larger proportions with education, commerce, arts, social sciences, and health qualifications.

Chart 4

Data Source: Alberta's Occupational Supply Outlook Model, 2007-2017

Chart 5 shows the average annual growth rates for males and females in each major field of study over the forecast period 2007 to 2017. Males are anticipated to have higher growth rates than females in commerce, education, and engineering. Females are expected to have higher growth rates in applied and social sciences.

Chart 5

Data Source: Alberta's Occupational Supply Outlook Model, 2007-2017

Major Fields of Study: University

Chart 6 shows the average proportions over the forecast period of 2007 to 2017 of all university graduates in each major field of study by gender. A higher proportion of females than males are expected to have qualifications in education, arts, humanities, social sciences, and health fields of study. Males have higher proportions with commerce, engineering, and mathematical and computer sciences qualifications. These are the fields that have traditionally been dominated by one gender or the other.

Chart 6

Data Source: Alberta's Occupational Supply Outlook Model, 2007-2017

According to Chart 7, females have higher average annual growth rates than males for all of the major fields of study over the forecast period of 2007 to 2017. This is because the enrolment rates for females are expected to increase at a faster rate than for males over the forecast period.

Chart 7

Data Source: Alberta's Occupational Supply Outlook Model, 2007-2017

Summary and Conclusion

Over the coming decade, 2007 to 2017, the overall level of educational attainment in Alberta is expected to increase as more people enroll in post-secondary institutions. It is anticipated that the enrolment rates of post-secondary education for females will increase more over the forecast period than for males, resulting in a higher proportion of females having obtained a post-secondary education.

There are many differences between what types of diplomas and degrees post-secondary graduates are receiving according to what type of institution they have attended. Males have a higher proportion than females with qualifications in applied science technologies and trades at both educational attainment levels; however, females are expected to have high average annual growth rates in this field over the forecast period. On the other hand, females have higher proportions with qualifications in health from both types of institutions.

According to Alberta's Occupational Demand and Supply Outlook, 2007-2017² occupations related to the trades and health major fields of study are expected to be in need of labour over the coming decade. Therefore, ways of attracting people of the non-traditional gender into these fields of study could be looked at to help ease potential labour shortages.

Appendix A

Major Fields of Study

- ⬇ Educational, recreational, and counseling services
- ⬇ Fine and applied arts
- ⬇ Humanities and related fields
- ⬇ Social sciences and related fields
- ⬇ Commerce, management and business administration
- ⬇ Agricultural, biological, nutritional, and food sciences
- ⬇ Engineering and applied sciences
- ⬇ Applied science technologies and trades
- ⬇ Health professions and related technologies
- ⬇ Mathematics, computer, and physical sciences
- ⬇ No specialization

Appendix B

Education Assumptions

A number of assumptions are used to derive the results of this forecast. The assumptions used to generate the results in Appendix C are described below.

Enrolment and Graduation

- The number of people who attend school is calculated as a share of the total number in that age or gender group. This proportion is based on historic shares.
- The secondary school enrolment rate for males and females remains constant over the projection period.
- Enrolment rates for post-secondary institutions increase at the same rate as the average of the high and low enrolment rate projections that were conducted by Alberta Advanced Education and Technology.
- Graduation rates are determined by level of schooling, major field of study, age and gender. Graduation rates are calculated as a share of those who could potentially graduate and are kept constant over the forecast period.
- The overall number of university, college and trades graduates is determined by applying the graduate rate to the different age groups who are enrolled in that institution and could potentially graduate.
- Drop-out rates and mature student rates are used for the different major fields of study and level of schooling.
- Migration rates by educational attainment are allowed to adjust to reflect relative demand conditions in Alberta.

Educational Attainment

- To calculate the number of people with university, college and trades, and high school education, a stock-flow approach³ was used.

³ **Stock-Flow Approach:** A method in estimating the future population of people in a group of interest. To find the forecasted population, the population from the previous year is adjusted to add those expected to enter that group and subtract those that are expected to leave that group. **Example:**

$$\begin{array}{ccccccc} \text{Number of} & & \text{Number of} & & \text{Recent} & & \text{People Leaving} \\ \text{people with} & = & \text{people with} & \text{plus} & \text{Graduates of} & \text{minus} & \text{Group due to} \\ \text{College/Trades} & & \text{College/Trades} & & \text{College/Trades} & & \text{death,} \\ \text{Training} & t+1 & \text{Training} & t & & t+1 & \text{retirement, etc.} & t+1 \end{array}$$

Appendix B

- Those with less than a high school education are determined to be those not already accounted for in other educational attainment categories.
- Less than high school educational attainment is adjusted to reflect the estimated portion of mature students in post-secondary institutions that do not have a high school diploma. High school educational attainment is also adjusted to subtract recent graduates from university and college and trades.
- The overall enrolment rate for mature students is used for all age groups within the mature student category.
- To project educational attainment by major field of study, the historic relative enrolment rate is maintained over the projected period.
- The share of new graduates by major field of study is constant over time.
- University transfer programs are included as university enrollment and university certificates are classified as college and technical.
- Educational attainment is based on the new graduate forecast plus net inflows from migration less deaths.

Appendix C
